Integrated Software Project

Assignment 5

Final System Presentation and Demonstration

Assessment information	Details
Module code	ISJ107V
Assessment weighting	40% of the final module mark
Total marks	50 marks
Presentation schedule	To be communicated by the lecturer
Assessment type	Individual
Submission	Presentation

Purpose

Present and defend the completed Integrated Software Project. The final presentation must show how the identified problem, approved requirements, UML design and emerging technology were translated into a functional and evaluated software system. Students must demonstrate the system live, explain the technical decisions and respond to questions using credible project evidence.

Instructions

- Present the completed version of the approved project and clearly identify any outstanding features or approved changes.
- The presentation is 12 to 15 minutes, followed by approximately 5 minutes of technical questions. The lecturer will communicate the timetable and venue.
- Each student must attend the allocated session, participate in the presentation, demonstrate the system and answer individual technical questions.
- Use final, readable UML diagrams that are consistent with the implemented system and use the same names as the application and documentation.
- Submit final presentation slides, editable UML files and an accessible final repository through MyTUTor before the presentation.
- Prepare a tested local or offline fallback for the live demonstration in case internet access or an external service fails.

Question 1 Total Marks [6]

Introduce the completed project and establish a clear basis for the final demonstration.

1.1 Present the project title, problem statement, intended users, project aim and the value provided by the completed system. (2)

1.2 Summarise the final scope and key functional and non-functional requirements. Clearly identify any approved changes or incomplete items. (2)

1.3 Provide a logical presentation roadmap and introduce the technology stack and emerging technology used in the project. (2)

Question 2 Total Marks [16]

Demonstrate a coherent, stable and usable final system using realistic data.

2.1 Demonstrate the principal end-to-end user workflow, including navigation, validation, data processing, meaningful output and recovery from invalid input. (6)

2.2 Demonstrate the emerging-technology component in operation and explain how its output supports a system decision, service or user task. (4)

2.3 Demonstrate data persistence or integration through the database, dataset, API, device or other approved service. (3)

2.4 Demonstrate relevant security, privacy, reliability and access controls, and explain how sensitive credentials and errors are handled. (3)

Recommended demonstration evidence format:

Requirement	Status	Prototype feature	Test case	Evidence
FR-01	Completed	Core user workflow	TC-01	Live demonstration
ETR-01	Completed	Emerging-tech service	TC-05	Output and metric

Question 3 Total Marks [10]

Use selected UML models to explain the structure, behaviour and deployment of the completed system.

3.1 Present the final use-case diagram and use it to identify the actors and major system services demonstrated. (2)

3.2 Present the final class diagram and explain the key classes, relationships and design decisions implemented in the system. (2)

3.3 Present one sequence or activity diagram that accurately explains the demonstrated end-to-end workflow and emerging-technology interaction. (2)

3.4 Present the component and deployment views, showing application modules, databases, external services and the physical or cloud environment. (2)

3.5 Explain the consistency between the requirements, UML models and final implementation, including any justified deviations. (2)

Question 4 Total Marks [8]

Present evidence that the final system satisfies its objectives and can be used responsibly.

4.1 Summarise functional, integration, system and user acceptance results, including the number of tests passed, failed and unresolved. (3)

4.2 Present at least two quantitative performance or quality measures and one emerging technology evaluation metric, where applicable. (2)

4.3 Explain the expected user or organisational benefit and discuss one important ethical, privacy, security or accessibility consideration. (2)

4.4 State the principal limitation and one realistic future enhancement. (1)

Question 5 Total Marks [10]

Communicate the project clearly and demonstrate individual mastery of the completed work.

5.1 Use clear narrative, readable slides, appropriate visuals and professional verbal delivery within the allocated 5 minutes. (3)

5.2 Coordinate the transition between explanation and demonstration, manage time effectively and use a prepared fallback if required. (2)

5.3 Answer technical questions accurately using evidence from the requirements, UML models, source code, data, testing and deployment. (3)

5.4 Explain personal contribution, key lessons learned and the most important design or implementation decision. (2)

Assessment rubric

Allocate marks within each band according to completeness, correctness, traceability, technical quality and consistency with the implemented system.

Criterion	Excellent	Competent	Developing	Insufficient
Question 1 6 marks	6 Project context, final scope, value and presentation roadmap are concise, accurate and compelling.	4-5 Context and scope are mostly clear, with minor omissions or weak transitions.	2-3 Basic project information is present, but the rationale, scope or structure is unclear.	0-1 Project context and presentation direction are substantially missing.
Question 2 16 marks	14-16 A stable and usable final system demonstrates the full workflow, emerging technology, realistic data and appropriate controls.	10-13 Core system and integration work well, with minor functional, data or reliability gaps.	6-9 System is partly functional, but the workflow, data or emerging-technology integration is limited.	0-5 System is largely non-functional, disconnected or cannot demonstrate the required integration.
Question 3 10 marks	9-10 Selected UML models are correct, readable and fully aligned with requirements, architecture and implementation.	6-8 Models explain the final system well, with minor notation or consistency errors.	3-5 Most models are present but simplified, inconsistent or contain several errors.	0-2 Models are missing, unreadable or unrelated to the final system.

Criterion	Excellent	Competent	Developing	Insufficient
Question 4 8 marks	7-8 Evaluation is evidence-based and links test results, metrics, impact and responsible-use considerations.	5-6 Sound evaluation covers most required areas, with limited evidence in one area.	3-4 Some results are shown, but metrics, impact or responsible-use analysis is incomplete.	0-2 Little credible evaluation or impact evidence is supplied.
Question 5 10 marks	9-10 Presentation is polished and well timed; technical answers and contribution reflection show strong individual mastery.	6-8 Clear professional delivery with minor timing, coordination or response weaknesses.	3-5 Delivery is uneven or weakly supported during technical questioning.	0-2 Presentation is unprepared, poorly communicated or individual understanding is not evident.
